Deployment
= safeguard
GMI
(one parameter set,
tuned by simulation)
SDI
(one parameter set per
disruption status)
states
Label visited states by
rollouts on common
random numbers
new states
Second labelling pass
on states the trained
policy visits (4.5)
Confirmation test
on fresh futures
(Section 4.3)
accepted
labels
Classifier with a prior
on SDI's order
(Section 4.4)
Deployment gate: keep
SDI unless the policy
wins in validation (4.7)
Ensemble of E networks
from independent
training sets (4.6)
S-DCL policy
fallback: SDI's order
